

VAYUSANGAM | OpenAQ COLLECTION STATUS

Status addendum to the dataset prerequisite inventory | Checked 30 Sep 2026, 11:47 IST

FULL HISTORICAL PULL IS IN PROGRESS - NOT COMPLETE

The raw cache is growing, while the completed manifest and normalized CSV still describe the validated 3-day sample. This page supersedes the earlier OpenAQ counts on the inventory pages that follow.

Verified sample currently in the normalized files

SAMPLE WINDOW	STATION	OBSERVED VALUES
72 hourly rows 2026-09-28 to 2026-09-30	1 station GK1 (Oberoi Terrace)	PM2.5: 51 Temperature: 51 Relative humidity: 51

Other requested variables have zero normalized observations in this sample; nulls are preserved, not filled. Sample validation passed. This is an API sample, not scientific validation.

Collection inventory at this check

Artifact / evidence	Current verified state
Station discovery	220 locations; 209 report a PM2.5 sensor; 167 have declared PM2.5 history overlapping 2024-01-01 to 2026-09-30.
Sensor metadata	9 sensor lookups returned persistent HTTP 500 and are marked error; availability for those locations is unknown.
Hourly output / manifest	72 rows for 1 station. Manifest still has sample_mode=true and dates 2026-09-28 to 2026-09-30.
Raw hourly cache	3,941 JSON response files at check time. This includes previous cache plus partial full-range responses; it does not prove complete coverage.
Quality report	23 sample quality records; validator passed for the sample only.

Full-range collection and next steps

The configured source period remains 2024-01-01 through 2026-09-30. Raw monthly chunks are being cached resumably, but no complete full-range manifest, hourly CSV, or quality report exists yet. If collection stops, rerun `.venv/bin/python scripts/data_collection/openaq/download_openaq.py`; cached responses are reused. After it completes, run `.venv/bin/python scripts/data_collection/openaq/process_openaq.py` and `.venv/bin/python scripts/data_collection/openaq/validate_openaq.py`.

Other inventory conclusions on the following pages remain unchanged: historical surface meteorology is present; forecast NWP, PBLH/upper-air data, CAMS and FIRMS remain absent or unverified. OpenAQ hourly values are not a verified CPCB feed.
